

Group A — Weekly Diary 30 May 2026

Backend Team: Andrejs Grisin, Vitalina Alipova, Anastasia Petrova, Alan Kurilov

Frontend Team: Igor Sieradzki, Anca Morosan, Arushee Kumar, Kunal Sharma

1. Backend Team

Anastasia Petrova

Bankruptcy logic (app/services/default_services.py, app/models/users.py): Added bankrupt_at (DateTime, nullable) column to the users table with an Alembic migration. check_and_handle_bankruptcy(user, net_worth, db) triggers when net worth drops below \$100: liquidates all holdings at current market price (falls back to average_buy_price if the API is unavailable), records a sell trade for each position, cancels all active auto-trades, sets is_bankrupt = True + bankrupt_at; idempotent.

recover_from_bankruptcy(user, db) resets balance to \$1,000 and clears is_bankrupt; preserves bankrupt_at as a permanent historical record.

Trading integration (app/routers/trading.py, app/tasks/snapshot.py): Bankruptcy check is called after every successful buy and sell. Daily snapshot task also runs the check, so bankruptcy can be detected without any trading activity.

Recovery endpoint (app/routers/users.py): POST /api/users/me/recover resets a bankrupt account; returns 400 if the account is not bankrupt. bankrupt_at is now exposed in UserPublicResponse.

Docstrings: Google-style docstrings added to all public functions, endpoints, and the User model `app/core/security.py` (`hash_password`, `verify_password`, `create_access_token`, `decode_access_token`), `app/core/auth_dependencies.py` (`get_current_user`), `app/routers/auth.py` (`register`, `login`), `app/models/users.py` (User class), `app/services/default_services.py` (`check_and_handle_bankruptcy`, `recover_from_bankruptcy`).

Tests: `tests/core/test_security.py` 17 unit tests for password hashing, verification, JWT creation and decoding (including tampered/expired token cases). `tests/routers/test_auth_router.py` 20 integration tests for register, login, and token protection (invalid token, expired token, deleted user). `tests/routers/test_bankruptcy.py` 20 tests covering the full bankruptcy lifecycle via service layer and HTTP routes.

`tests/services/test_default_services.py` 21 unit tests for `check_and_handle_bankruptcy` and `recover_from_bankruptcy` directly against the DB.

Documentation: `docs/bankruptcy.md` (new) purpose, endpoints, request/response examples, business rules, error cases, DB models, test guide. `docs/authentication.md` (new) same structure, covering registration flow, JWT lifecycle, `get_current_user` dependency, env config, curl examples. `docs/db_schema.md` (rewritten) full column tables with types/nullability/defaults for all 6 tables, FK relationships, migration history.

Vitalina Alipova

Implementation + conclusion report written. `auto_trades.md` documentation written. Docstrings added for the auto-trading logic (`auto_trades`, `services`).

Tests: auto-trading: test_get_networth (cash + stock value = correct total), test_create_auto_trade (auto trade gets created and returns an id), test_get_auto_trades (returns list of active auto trades), test_delete_auto_trade (soft delete works correctly). All 11 BE2 tests are now passing, testing is complete.

Tests: trading: test_buy_stock_insufficient_funds (returns 400 when balance too low), test_buy_stock_bankrupt (returns 403 when account is bankrupt), test_sell_stock_success (sell works when holding exists), test_sell_stock_not_enough (returns 400 when trying to sell stocks you don't own).

Infrastructure fixed: import bug in conftest.py (from main import app); Redis crash in redis_client.py (no more raise on startup); Redis crash in main.py startup event (wrapped in try/except). First test written and passing: test_buy_stock_success.

Andrejs Grisin

Evaluation for report written. Docstrings for ranking added. Documentation written for README, leaderboard, portfolio and trades. Small bugs fixed.

Tests: test_buy_stock_success (verifies a buy order goes through correctly and returns the right fields), test_buy_stock_insufficient_funds (verifies the API returns 400 when the user can't afford the stock), test_sell_stock_success (verifies selling works when the user actually owns the shares).

Automated GCP deployment done, every push/merge to main triggers a new deployment to GCP (for backend and frontend URLs, see general dependencies). Fixed dependencies to make docker compose work again.

Alan Kurilov

Report — introduction and requirements sections written.

2. Frontend Team

Igor Sieradzki

Dashboard: replaced “Welcome, Trader” with the actual username from `useAuth()` — done, pulls from `authStore.user?.username`. Dashboard: added a warning banner, yellow below \$500, red below \$100. Profile: fixed the USERNAME card showing “—” fixed with an `onMounted` re-fetch.

Anca Morosan

Leaderboard page: new design and colours added. Default page design done. Navigation button added across all pages.

Kunal Sharma

Market: added category filter buttons : All / Tech / Finance / Energy / Healthcare. Market: added a 24h sparkline chart on each stock card. Trade modal: added “Price/share” and “Available cash” rows below the quantity input. Created a poster draft.

Arushee Kumar

Portfolio: added an AVG BUY PRICE column to the holdings table. Portfolio: added P&L (\$) and P&L (%) columns with green/red colouring. Portfolio: added stat cards above the table: Total P&L, Today's P&L, number of positions.

Summary

Backend work this week centred on the bankruptcy feature end-to-end: schema migration, service logic, trading and snapshot integration, a recovery endpoint, full Google-style docstrings, and 78 new tests across security, auth, and bankruptcy. Auto-trading and core trading flows (buy/sell, insufficient funds, bankrupt-account handling) were also tested and documented, infrastructure issues (Redis startup crashes, a conftest import bug, docker compose) were resolved, and automated GCP deployment was set up on every push to main.

Frontend work focused on polish and usability across the Dashboard, Profile, Market, Trade modal, Portfolio, and Leaderboard: real username display, low-balance warning banners, a fixed profile field, market category filters and sparkline charts, clearer trade modal pricing info, P&L tracking with colour coding and summary stat cards on the Portfolio page, and a new Leaderboard design with consistent cross-page navigation.
